Assignment 1 - Predicting PM2.5

In this assignment, you will practice using Gradient Descent to predict PM2.5.

Announcement

10/13

- report 中 public + private 分數的意思是: testing中240筆的RMSE, 也就是 square root {[(public)^2+(private)^2]/2}
- testing答案釋出!
- hw1_best.sh: 選擇的2筆kaggle分數中, private較好的那一個model (註: 不用完全一模一樣 重現,可接受誤差+0.2)
 - ex. (1) public:6.5/private:5.5 (2) public:6.1/private:5.7
 - 。滿足hw1 best.sh 的 private分數 < 5.5 + 0.2 即可
- hw1.sh: public分數 > public simple baseline 即可
- kaggle的成績:只要2筆中任何1筆>某baseline,即得該baseline成績
- github死線: 今晚午夜

10/6

- 10/5有通過public simple baseline名單 Ⅲ
 - 。因 kaggle名稱…等等原因沒有被登記到的同學,請填寫 Ⅲ

重要連結

- 投影片連結 🔐
- 老師講解投影片 🔐
- Kaggle 連結 🏆
- Github Repo 表單 📑
- report template
- 遅交表單 ②
- 10/6(五)上課時間, 助教會釋出hw1的Sample Code以及Supplementary Slide, 同時會邀請小老師幫大家解決程式問題。
- (已截止)小老師教學表單 🕛

The requirements of this assignment are as follows:

- hw1.sh
 - Python3.5+ required
 - Only (1)numpy (2)scipy (3)pandas are allowed
 - numpy.linalg.lstsq is forbidden.
 - Please handcraft "linear regression" using Gradient Descent
 - beat public simple baseline
 - For those who wish to load model instead of running whole training precess:
 - please upload your training code named train.py
 - as long as there are Gradient Descent Code in train.py, it's fine
- hw1 best.sh
 - Python3.5+ required
 - any library is allowed
 - meet the higher score you choose in kaggle

Data 簡介

- 下載 train.csv: 每個月前20天每個小時的氣象資料(每小時有18種測資)。共12個月。
- 下載 test.csv: 排除train.csv中剩餘的資料,取連續9小時的資料當feature,預測第10小時的PM2.5值。總共取240筆不重複的test data。
- 下載 sampleSubmission.csv

作業修正&講解

- report第五題題目修正: X = [x^1 x^2 ... x^N] 改為 X = [x^1 x^2 ... x^N]^T
- 第1-3題請都以題目給訂的兩種model來回答

FAQ

- Q1. 為了回答report(1)-(3)是不是要上傳kaggle 8次,這樣會浪費kaggle上傳的coda Ans. 同學可以先把model訓練好的答案做好,等到kaggle死線之後便可以無限上傳看error了
- Q2. 如果預先對training data做normalization,那我可以上傳train.csv然後在hw1.sh中自己讀進來嗎

Ans. 可以
